

Usage of AI

Artificial intelligence tools (specifically ChatGPT) were used to support the implementation of this project. The following prompts were used:

1. **“Scikit how to make a confusion matrix pretty”:**
2. **“Is it normal for KNN and KNN Grid to give different optimal Ns?”**
3. **“How many options are too many options for fitting a feature in a predictive model” (used to decide how to limit the number of breeds and the number of colors)**
4. **Documentation and Style Suggestions:**

Prompts were used to make minor formatting adjustments (graph color options, “make the title print away from the graph above in the subgraph”, little things like this) to ensure that the project looks neat and professional.
5. **General Troubleshooting:**

AI was consulted to clarify error messages and best practices in using [GridSearchCV](#), especially when I ran into the issue where the f1 scoring metric worked on my local, but not on the class VM. I talked to Professor Stubbs and Ms. Anika about this and ended up changing the scoring to accuracy so that the code would compile + because technically accuracy is better suited for this practice.
6. **“What all did I ask you about in regards to this project?”**

This prompt was used to help me make this document.
